The experts in flow cytometry and hematopathology have been invited to provide insightful reviews and summary of practical flow cytometry applications and updates in a specific group of diseases. These articles are peer-reviewed and intend to provide an objective and exhaustive review of the state-of-the-art of flow cytometry in a given area of hematopathology.

Flow cytometry (FCM) is an instrumental tool for rapid detection and characterization of microbial cells based on their light scatter and fluorescence properties. FCM allows analysis of complex populations according to user-defined cell characteristics, with typical analysis rates approaching 10 000 cells s⁻¹.
