Heat and cold storage is capable not only of providing flexibility to heating appliances based on heat coming directly from RES such as solar thermal heating but also of supporting the integration of the heat and electricity sector (e.g. by means of smart electric thermal storage (SETS)) and electric heat pumps).

Heat and Cold Storage | EASE: Why Energy Storage? | EASE

More than 40 percent of the final energy demand in Germany is used for the provision of heat and cold in buildings. Consumption is subject to strong seasonal, daily and weekly fluctuations. Thermal storage is therefore a key technology for ensuring the flexible provision of heating and cooling in buildings. By using thermal and also electrical storage solutions, the generation and consumption of renewable energy can be decoupled from each other.

TU/e has a Heat and Cold Storage (ATES) installation which is one of the biggest of its kind in Europe. The ATES has been executed with two central rings; a cold ring and a hot ring. Buildings can independently use heat and cold simultaneously, while heat and cold can be exchanged on the rings. This is a unique feature of the installation at TU/e. A total of 70% of the built-up area of TU/e (19 buildings) is connected with the ATES.

Heat and Cold Storage (ATES)

Thermal energy storage (TES) allows the storage of heat and cold to be used later. TES is also known as heat or cold storage. TES can aid in the efficient use and provision of thermal energy whenever there is a mismatch between energy generation and use. This mismatch can be in terms of time, temperature, power, or site.

Underground thermal energy storage (UTES) uses the ground to store heat and cold. Depending on the geological, hydrogeological and other site conditions, ATES (aquifer TES), BTES (boreholes TES) or CTES (cavern TES) is selected as a storage system. ATES and BTES are commercial today, CTES is rarely applied commercially.
