The changing academic library [electronic resource] : operations, culture, environments / John M. Budd. Format E-Book Edition 2nd ed. Published Chicago : Association of College and Research Libraries, a division of the American Library Association, 2012.

Description 1 online resource (412 p.) URL

The changing academic library operations, culture ...

Academic libraries are in a state of change. New technologies such as the Internet are creating both opportunities and confusion. Combine this with broader context of educational needs, the explosion in very expensive scholarly periodicals, the ever present budgetary problems, and the profusion of remote campuses.

"The Changing Academic Library is a revision of Budd's The Academic Library: Its Context, Its Purpose, and Its Operation. This book has been completely updated and revised to reflect the dynamic states of higher education and academic libraries. It presents a critical examination of major issues facing colleges and universities and the unique challenges that their libraries must come to grips with. Current practice is reviewed, but it is examined in the broader context of educational needs, scholarly communication, politics and economics, technology, and the nature of complex organizations."--Publisher's description.

"Offers a wide range of perspectives on how to interpret and apply library values in the context of emerging technologies... Divided into two sections -- Contemplating library values and Applying library values -- and using the ALA's Core Values of Librarianship as the primary reference point, chapters emphasize the underlying frameworks that guide librarian practice and capture practical, real-world applications that can ideally serve as a starting point for other librarians encountering similar issues, even if the specific technology or set of values may differ"--

As higher education has evolved through recent decades, college and university libraries also have forged pathways to serve faculty and students more effectively. Academic and research libraries have been early adopters of digital technologies and have provided leadership and training to help remake the academic enterprise. Universities and libraries are operating in a rapidly changing information environment. In this context, libraries have been redefined as facilitators to a world of information far beyond physical collections, providing access to global information through online resources and systems, and also creating their own digital content. Staff and student expectations are developing in line with these changes in the teaching, research and scholarly communication environment. Libraries need to take a strategic role in supporting academics and students within this technologically rich and constantly evolving context. Digital collections and digital scholarship are now mainstream library activities, core to research and teaching. The technology environment will be constantly and rapidly changing, with the expectations and requirements of information users increasing, and with libraries needing to provide an excellent search and discovery experience for their customers. As access to mobile devices becomes ubiquitous, users will expect seamless access to information and services, provided anywhere, anytime. The Changing Academic Library: Operations, Culture and Environment provides academic administrators and librarians a better understanding of the issues facing the library during this time of change, and the role of the library in the evolving campus of the future. It helps academic librarians plan, implement, and manage changes to the fundamental structure of their organizations.

Access to scientific literature for research and teaching is a problem that re-searchers constantly face. In the globalization of the academy, as well as politi-cal developments in the world, the conditions for the receipt of new books in library collections and bookstores are changing. Many publications exist only in electronic format, which also affects the possibility of their inclusion in library catalogs and databases. In view of the information flow, they are often simply not aware of the publication of new publications, especially those prepared in small regional universities. Obviously, the most acute question is what publica-tions scientific libraries have the opportunity to acquire in these conditions. This book plans to present a series of materials on the state of scientific libraries. The current state and prospects for the development of academic libraries is a problem. Undoubtedly, over the past two decades, there have been significant changes in the logistical support of libraries, the information approach to library activities, and the professional level of staff. These changes occur on the general background of all accelerating technological progress and colossal transforma-tions in the information space. At the same time, in the academic environment, all of the above is significantly behind the world trends and standards. One of the most important parts of a library is its doctrine because the library is a central institution, the totality of which constitutes a more complex system called librarianship. This book provides insights into not only an understanding of the library as a key production unit of library service system, but also library science, the developed system, and forms of libraries of different types. The question of what a library is, when, how and why it occurred, what are the ways of the past, its contemporary social functions, structure, mechanism of action, and its main types, are fundamental to a proper understanding of a library. In order to just answer it, one can make a full and clear understanding of the mis-sion of libraries in modern society, the main round of the librarian profession and how to implement them . The historical aspect of this issue is considered an important professional discipline of history of library work in the world. Currently, there is no targeted recruitment. This is partly due to the funding of libraries. Often, the collection of library funds occurs at the expense of gifts, as a result of one-time, unsystematic exchanges, which leads to a chaotic re-plenishment of the fund. There are problems with subscriptions to professional periodicals because of their high cost and delivery problems. Most libraries have both basic and exchange funds in their composition. The latter is in active movement, as one of the main sources of literature for the past two decades are book exchange and gifts. Primarily these are unsystematic and uncontrolled processes, the only stable receipt among them is the international non-exchange book exchange, through which the NBUB academic libraries receive foreign profile literature. There are different standards for bibliographic description. This complicates the library interaction between various countries. In the developed countries of the world at one time, the bibliographic description standard, developed, and was adopted; the IRBIS software was built on the same standards. The lack of domestic standards, and work on software that supports foreign standards, will entail a huge resource problem. This lack of a common vision and coordination within the Academy and has resulted in the existence of different programs or their complete absence. There is no universal system of corporate cataloging. The problem of funding a scientific library is always relevant . Usually this state ranges from bad to very bad and is an integral component of almost any library problem. On the other hand, inadequate funding is often simply written off unwillingness to move and do something. The premises reserved for library collections are often crowded and do not always correspond to the conditions necessary for storing the fund. The problem of safety of funds has several aspects: physical safety, observance of necessary temperature regimes, as well as a lack of areas for the placement of funds. Often the problem can be solved only by changing the room or location to another, which is a large project. Often, libraries are not priority units in the distribution of computer equipment or peripheral equipment within institutions. It takes a lot of serious effort to justify the need to supply both the technology and the purchase and payment of techni-cal support for the library. In the rapidly changing information space, the task of lifelong learning is topi-cal. At the same time, there are few Free State educational programs, and the number and variety of paid ones is limited. The range of offers is small, con-sidering both the specifics and low demand, since paid programs are almost inaccessible due to lack of financial support for potential participants. More often, professional development is limited to several one-day seminars a year, organized by the Library Association. Even in a more difficult situation there are the employees working outside the capital without access to these seminars, for webinars are still not widely distributed, and business trips are associated with additional costs and other problems. There is no information network within the academic environment. Most likely, non-established horizontal communication links are an interlibrary problem, which, if desired and with the availability of today's opportunities, is simple enough to solve. Perhaps it is not yet fully understood? All these problems exist, of course, in a complex and interrelated way. It is possible to count on positive changes in the situation with academic libraries with the active participation of three sides of the process - librarians, administrations and scientists. In our opinion, these fluctuations within the general trend depend primarily on the personal component, both on the staff of the library itself and on the institution's administration and on the researchers themselves. However, cardinal changes, successful solutions to tasks that go beyond one in-stitution, such as: changing the structure of funding, creating the conditions for attracting new young cadres, implementing joint scientific and technical projects aimed at building a corporate network within system, a consolidated electronic catalog of the academic network, creating proprietary electronic resources and digital libraries, provision of unified software search superstructures, etc., are in the sphere of opportunities for more global and institutional unity. And here, in turn, the direction of the state's cultural strategy, the reform of the academy of sciences system is important. As a result, a change of priorities and focus not only on satisfying the needs of science and maximizing the effective use of its potential, but also on the disclosure of its potential (especially in the humani-ties) to create an accessible scientific and popular resource, is needed.

Examining the academic library within a contextual framework (of colleges, universities, and American society), this work provides analysis of the institution's content and function. Rather than concentrating on management issues, this book emphasizes the structure, organization, decision making and operations of academic libraries.

This report provides Association of College and Research Libraries (ACRL) leaders and the academic community with a clear view of the current state of the literature on value of libraries within an institutional context, suggestions for immediate "Next Steps" in the demonstration of academic library value, and a "Research Agenda" for articulating academic library value. Its focus is to help librarians understand, based on professional literature, the current answer to the question, "How does the library advance the missions of the institution?" This report is also of interest to higher educational professionals external to libraries, including senior leaders, administrators, faculty, and student affairs professionals.

This volume addresses an emerging yet largely unexamined strategic priority for academic and research libraries: interdisciplinarity in the academy. As colleges and universities chart new areas for knowledge creation, teaching, learning, outreach and service, libraries face challenges in developing their response to these transformational changes in higher education. The global networked society, the convergence of multiple areas of study, and the need to address major challenges that transcend any particular discipline are framing issues for twenty-first century institutions of higher education. Library leaders must seize this exciting opportunity to place the library at the center of the emerging interdisciplinary academy by creating and delivering a transformative suite of programs, services and collections. Libraries can lift their institutions to a higher plane of interdisciplinary activity by leveraging their place in higher education to become the hub of interdisciplinary activity, where librarians foster innovative models of teaching, learning, research, conversation, reflection, and engagement. This book offers multiple perspectives on transforming academic library programs, collections, and services to meet transformational challenges for higher education. Experienced librarians bring an interdisciplinary perspective to collection development, information literacy, digital projects, knowledge organization, services for research centers, and other timely and relevant topics.

Academic libraries are in the midst of significant disruption. Academic librarians and university administrators know they need to change, but are not sure how. Bits and pieces of what needs to happen are clear, but the whole picture is hard to grasp. Reimagining the Academic Library paints a simple straightforward picture of the changes affecting academic libraries and what academic librarians need to do to respond to the changes would help to guide future library practice. The aim is to explain where academic libraries need to go and how to get there in a book that can be read in a weekend. David Lewis provides a readable survey of the current state of academic library practice and proposes where academic libraries need to go in the future to provide value to their campuses. His primary focus is on collections as this is the area with the greatest opportunity for change and is the driver of most library cost. Lewis provides an accessible framework for thinking about how library practice needs to adjust in the digital environment. The book will be useful not only to academic librarians, but also for librarians to share with presidents and provosts who a concise source for understanding where and how to focus their expenditures on libraries.
