Schnaiberg's concept of the treadmill of production is arguably the most visible and enduring theory to emerge in three decades of environmental sociology. Elaborated and tested, it has been found to be an accurate predictor of political-economic changes in the global economy. In the global South, it has figures prominently in the work of structural environmental analysts and has been used by many political-economic movements. Building new extensions and applications of the treadmill theory, this new book shows how and why northern analysts and governments have failed to protect our environment and secure our future. Using an empirically based political-economic perspective, the authors outline the causes of environmental degradation, the limits of environmental protection policies, and the failures of institutional decision-makers to protect human well-being.

The authors analyse the difficulties involved in local environmentalism.

The environment, and how humans affect it, is more of a concern now than ever. We are constantly told that halting climate change requires raising awareness, changing attitudes, and finally altering behaviors among the general public-and fast. New information, attitudes, and actions, it is conventionally assumed, will necessarily follow one from the other. But this approach ignores much of what is known about attitudes in general and environmental attitudes specifically-there is a huge gap between what we say and what we do. Solving environmental problems requires a scientific understanding of public attitudes. Like rocks in a swollen river, attitudes often lie beneath the surface-hard to see, and even harder to move or change. In *Navigating Environmental Attitudes*, Thomas Heberlein helps us read the water and negotiate its hidden obstacles, explaining what attitudes are, how they change and influence behavior. Rather than necessarily trying to change public attitudes, we need to design solutions and policies with them in mind. He illustrates these points by tracing the attitudes of the well-known environmentalist Aldo Leopold, while tying social psychology to real-world behaviors throughout the book. Bringing together theory and practice, *Navigating Environmental Attitudes* provides a realistic understanding of why and how attitudes matter when it comes to environmental problems; and how, by balancing natural with social science, we can step back from false assumptions and unproductive, frustrating programs to work toward fostering successful, effective environmental action. "With lively prose, inviting stories, and solid science, Heberlein pilots us deftly through the previously uncharted waters of environmental attitudes. It's a voyage anyone interested in environmental issues needs to take." -- Robert B. Cialdini, author of *Influence: Science and Practice* "*Navigating Environmental Attitudes* is a terrific book. Heberlein's authentic voice and the book's organization around stories keeps readers hooked. Wildlife biologists, natural resource managers, conservation biologists - and anyone else trying to solve environmental problems - will learn a lot about attitudes, behaviors, and norms; and the fallacy of the Cognitive Fix." -- Stephen Russell Carpenter, Stephen Alfred Forbes Professor of Zoology, University of Wisconsin-Madison "People who have spent their lives dealing with environmental issues from a broad range of perspectives consistently abide by erroneous assumption that all we need to do to solve environmental problems is to educate the public. I consider it to be the most dangerous of all assumptions in environmental management. In *Navigating Environmental Attitudes*, Tom Heberlein brings together expertise in social and biophysical sciences to do an important kind of 'science education'-educating eminent scientists about the realities of their

interactions with the broader public." --the late Bill Freudenburg, Dehlsen Professor of Environment and Society, University of California, Santa Barbara

“ This is not only the best environmental sociology text I ’ ve used, but it is the best text of any type I ’ ve used in college-level teaching. ” – Dr. Cliff Brown, University of New Hampshire Join author Mike Bell and new co-author Loka Ashwood as they explore “ the biggest community of all ” and bring out the sociology of environmental possibility. The highly-anticipated Fifth Edition of *An Invitation to Environmental Sociology* delves into this rapidly changing and growing field in a clear and artful manner. Written in a lively, engaging style, this book explores the broad range of topics in environmental sociology with a personal passion rarely seen in sociology books. The Fifth Edition contains new chapters entitled “ Money and Markets, ” “ Technology and Science, ” and “ Living in An Ecological Society. ” In addition, this edition brings in fresh material on extraction between core and periphery countries, the industrialization of agriculture, the hazards of fossil fuel production, environmental security, and making environmentalism normal.

Green Gentrification looks at the social consequences of urban "greening" from an environmental justice and sustainable development perspective. Through a comparative examination of five cases of urban greening in Brooklyn, New York, it demonstrates that such initiatives, while positive for the environment, tend to increase inequality and thus undermine the social pillar of sustainable development. Although greening is ostensibly intended to improve environmental conditions in neighborhoods, it generates green gentrification that pushes out the working-class, and people of color, and attracts white, wealthier in-migrants. Simply put, urban greening "richens and whitens," remaking the city for the sustainability class. Without equity-oriented public policy intervention, urban greening is negatively redistributive in global cities. This book argues that environmental injustice outcomes are not inevitable. Early public policy interventions aimed at neighborhood stabilization can create more just sustainability outcomes. It highlights the negative social consequences of green growth coalition efforts to green the global city, and suggests policy choices to address them. The book applies the lessons learned from green gentrification in Brooklyn to urban greening initiatives globally. It offers comparison with other greening global cities. This is a timely and original book for all those studying environmental justice, urban planning, environmental sociology, and sustainable development as well as urban environmental activists, city planners and policy makers interested in issues of urban greening and gentrification.

This book offers an alternative analysis of the various theories and dimensions of green and environmental justice which are rooted in political economy. Much green criminological literature sidelines political economic theoretical insights and therefore with this work the authors enrich the field by vigorously exploring such perspectives. It engages with a number of studies relevant to a political economic approach to justice in order to make two key arguments: that capitalism has produced profound ecological injustices and that the concept of ecological justice (human and ecological rights) itself needs critiquing. *Green Criminology and Green Theories of Justice* is a timely text which urges the field to revisit its radical roots in social justice while broadening its disciplinary horizons to include a meaningful analysis of political economy and its role in producing and responding to environmental harm and injustice.

Drawing on the work of Allan Schnaiberg, this book returns political economy to green criminology and examines how the expansion of capitalism shapes environmental law, crime and justice. The book is organized around crimes of ecological withdrawals and ecological additions. *The Treadmill of Crime* is written by acclaimed experts on the subject of green criminology and examines issues such as the crime in the energy sector as well as the release of toxic waste into the environment and its impact on ecosystems. This book also sets a new research agenda by highlighting problems of ecological disorganization for animal abuse and social disorganization. This book will be of interest to students, researchers and academics in the fields of criminology, political science,

environmental sociology, and natural resources.

From St. Louis to New Orleans, from Baltimore to Oklahoma City, there are poor and minority neighborhoods so beset by pollution that just living in them can be hazardous to your health. Due to entrenched segregation, zoning ordinances that privilege wealthier communities, or because businesses have found the OCypaths of least resistance, OCO there are many hazardous waste and toxic facilities in these communities, leading residents to experience health and wellness problems on top of the race and class discrimination most already experience. Taking stock of the recent environmental justice scholarship, a Toxic Communities aexamines the connections among residential segregation, zoning, and exposure to environmental hazards. Renowned environmental sociologist Dorceta Taylor focuses on the locations of hazardous facilities in low-income and minority communities and shows how they have been dumped on, contaminated and exposed. Drawing on an array of historical and contemporary case studies from across the country, Taylor explores controversies over racially-motivated decisions in zoning laws, eminent domain, government regulation (or lack thereof), and urban renewal. She provides a comprehensive overview of the debate over whether or not there is a link between environmental transgressions and discrimination, drawing a clear picture of the state of the environmental justice field today and where it is going. In doing so, she introduces new concepts and theories for understanding environmental racism that will be essential for environmental justice scholars. A fascinating landmark study, a Toxic Communities a greatly contributes to the study of race, the environment, and space in the contemporary United States."

Believe in climate change. Or don't. It doesn't matter. But you'd better understand this: the best route to rebuilding our economy, our cities, and our job markets, as well as assuring national security, is doing precisely what you would do if you were scared to death about climate change. Whether you're the head of a household or the CEO of a multinational corporation, embracing efficiency, innovation, renewables, carbon markets, and new technologies is the smartest decision you can make. It's the most profitable, too. And, oh yes—you'll help save the planet. In *Climate Capitalism*, L. Hunter Lovins, coauthor of the bestselling *Natural Capitalism*, and the sustainability expert Boyd Cohen prove that the future of capitalism in a recession-riddled, carbon-constrained world will be built on innovations that cutting-edge leaders are bringing to the market today. These companies are creating jobs and driving innovation. *Climate Capitalism* delivers hundreds of indepth case studies of international corporations, small businesses, NGOs, and municipalities to prove that energy efficiency and renewable resources are already driving prosperity. While highlighting business opportunities across a range of sectors—including energy, construction, transportation, and agriculture technologies—Lovins and Cohen also show why the ex – CIA director Jim Woolsey drives a solar-powered plugin hybrid vehicle. His bumper sticker says it all: "Osama bin Laden hates my car." Corporate executives, entrepreneurs, environmentalists, and concerned citizens alike will find profitable ideas within these pages. In ten information-packed chapters, *Climate Capitalism* gives tangible examples of early adopters across the globe who see that the low-carbon economy leads to increased profits and economic growth. It offers a clear and concise road map to the new energy economy and a cooler planet.

In 1996 Argentina adopted genetically modified (GM) soybeans as a central part of its national development strategy. Today, Argentina is the third largest global grower and exporter of GM crops. Its soybeans—which have been modified to tolerate being sprayed with herbicides—now cover half of the country's arable land and represent a third of its total exports. While soy has brought about modernization and economic growth, it has also created tremendous social and ecological harm: rural displacement, concentration of landownership, food insecurity, deforestation, violence, and the negative health effects of toxic agrochemical exposure. In *Seeds of Power* Amalia Leguizam ó n explores why Argentines largely support GM soy despite the widespread

Read Free The Treadmill Of Production Injustice And Unsustainability In The Global Economy

damage it creates. She reveals how agribusiness, the state, and their allies in the media and sciences deploy narratives of economic redistribution, scientific expertise, and national identity as a way to elicit compliance among the country ' s most vulnerable rural residents. In this way, Leguizam ó n demonstrates that GM soy operates as a tool of power to obtain consent, to legitimate injustice, and to quell potential dissent in the face of environmental and social violence.
